Neisseria M. xanthu

Acinetoba

```
The invention relates to a novel L-amino acid producing bacterium of genus Escherichia, modified to enhance L-amino acid production by enhancing the activities of a protein. The novel bacterium is useful for producing L-amino acid e.g. L-Bhr, L-Val, L-Pro, L-Leu, L-Met and L-Arg, by cultivating the bacterium in a culture medium and collecting L-amino acid to be produced and accumulated from the culture medium. The present sequence represents a protein of the invention which causes increased L-amino acid production in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel L-amino acid producing Escherichia bacterium, is modified to enhance L-amino acid production by enhancing the activities of protein capable of making bacterium to have enhanced resistance to L-amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Voroshilova EB,

                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                          9
bacterium is useful for producing L-amino acids by fermentation, including L-threonine, L-valine, L-proline, L-methionine, or L-arginine. The genes are useful for improving L-amino acid productivity. This sequence corresponds to the b2682 protein, one of the L-amino acid biosynthesis pathway proteins. The protein is a putative transport protein within the biosynthesis pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gusyatiner MM;

                                                                                                                                                                                                                                                                                                                                                                  ò
                  The invention relates to an L-amino acid (A) producing bacterium (I) (belonging to the genus Escherichia), which is modified to enhance the production of (A) by enhancing the activities of proteins (G) or (H) in a cell of (I). Also described is a method for producing (A) comprising cultivating the bacterium is a method for producing (A) comprising and accumulated L-amino acid. The modified bacterium has the ability to grow on a minimal medium containing L-amino acid or its analog in a minimal concentration and ability to grow faster on a medium containing L-amino acid or its analog than the unmodified strain or the wild type strain, or the parental strain of the bacterium. The present sequence represents the E. coli b2862 protein which has L-amino acid excretion
                                                                                                                                                                                                                                                                     120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       63
                                                                                                   The invention describes a new isolated nucleic acid encoding a Klebsiel pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antibacterial; fungicide; insecticide; polymorphism; genetic analysis; detection; food; gene expression; plant; animal; microorganism; toxin; antibiotic; biopesticide; virulence factor; disease model; plague;

```
The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are gources of probles and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polymportides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and reable to alter recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The carry animals, vectors containing the genes and Ab are also useful cor therapeutically (to treat microbial infection by bacteria or fungilate are sensitive to P. luminescens encoded toxins or antibiotics) and as companied for identifying targets of human diseases for which P. C. buminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ۲;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     127 AKLVRNNRRWSENWMIGIAFSSWSSWVFGTVIGAFSGSGLLQGYPAVEAALGFMLPALFM 186
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               85
                                                                                                                                                                                          The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as comonents of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                             New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for preparing a vaccine composition against Klebsiella pneumoniae.
                                                                                                                                                                      The invention describes a new isolated nucleic acid encoding a Klebsiella pheumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   78 IAALTVMAMDVRHVLYGPSLRSRIIORLOKSKTALWAFGLTDEVFAAATAKLVRNNRRWS 137

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the activity and therefore identify compounds that may be used for the activity and therefore identify compounds that may be used for the activity and therefore identify compounds that may be used for the activity and therefore identify compounds that may be used for the activity and therefore identify compounds that may be used for the activity and therefore infections, e.g. endocarditis. AAH53091 to AAH55098 compounds the present invention. AAH55091 to AAH55098 compounds the present invention. AAH55091 to AAH55098 compounds all the polymucleotide sequences and primers which are used in the specifically claims all the polymucleotide sequences given in the specifically claims all the polymucleotide sequences given in the istand only qose up to SEQ ID NO:4455 to 4472, no sequences are given in the disclosure for SEQ ID NO:4455 to 4472, no sequences are given
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                134 RRWSENWMIGIAFSSWSSWVFGTVIGAFSGSGLLQGYPAVEAALG--FMLPALFMSFLLA 191

The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins expressed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for bosynthesis and blodegradation, especially biosynthesis of Vitemain B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related organisms. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the composition of the printed specification, but was obtained in electronic format directly from WIPO at the composition of the printed specification and modulate the composition of the printed specification, but was obtained in electronic format directly from WIPO at the composition of the printed specification and work of the printed specification and work of the printed specification and work of the printed specification and the composition of the composition of the composition was obtained in electronic format directly from WIPO at the composition of the composition of the composition was obtained and the composition of the composition was obtained to the composition of the comp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Staphylococcus epidermidis; open reading frame; ORF; bacterial infection; antibacterial; gene therapy.

ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35144 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site

INST GENOMIC RES

```
Greptococcus/GBS (Streptococcus adalactiae) or group A streptococcus/GBS (Streptococcus adalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acide encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acide encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity characteraphy, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       7;

The present invention relates to novel Streptococcus agalactiae nucleotide sequences (I; ADV78860-ADV78998 and ADV83341-ADV85476) and nucleotide sequences (I; ADV7899-ADV81203 and ADV83341-ADV85476) and novel polypeptides of (II; ADV78999-ADV81203 and ADV81340). The synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, cucleotide metabolism including purines, pyrimidines and/or nucleosides, regulatory functions, replication, transcription, translation, protein transport, adaptation to atypical conditions, sensitivity to medicines and/or analogues, functions related to transposons, biosynthesis of coffactors, prosthetic groups and transporters, cell membrane proteins and cellular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for the detection and/or amplification of Streptococcus agalactiae is given in ADV81204. Note: The present patent is an equivalent for the basic patent FR2824074A1, which

The invention relates to a protein (ABP25413-ABP30895) from group B careptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acides encoding (I), ABN6604-ABN71526 and activity. (I), nucleic acide encoding (I), as a sease caused by composition or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. C. Nucleic acide encoding (I) are used to detect Streptococcus in a composition comprising (I) or a nucleic acid encoding (I), may be cused as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic cused an accine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic cused in gene therapy. Antibodies to (I) are used for affinity characterial and distinguishing/identifying Streptococcus proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to novel Streptococcus agalactiae
nuclectide sequences (I; ADV87607-ADV87745) and novel polypeptides (II;
ADV87746-ADV89950). The nuclectide sequences encode polypeptides of S.
agalactiae involved in the synthesis of amino acids, cell membranes,
intermediate (central) metabolism, energetic metabolism, fatty acid and
phospholipid metabolism, nucleotide metabolism including purines,
pyrimidines and/or nucleosides, regulatory functions, replication,
transcription, translation, protein transport, adaptation to atypical
conditions, sensitivity to medicines and/or analoques, functions related
to transposons, biosynthesis of cofactors, prosthetic groups and
transposons, biosynthesis of cofactors, prosthetic groups and
transposons, cell membrane proteins and cellular machinery (I) are
transporters, cell membrane proteins and cellular machinery
cuseful for the detection and/or amplification of nucleic acids.
Pharmaceutical composition comprising (I) or (II) are useful for
treatment of a bacterial S. agalactiae infection. Note: WO200292818A2 is
                                                                                                                                                                                                                                            75 SLWIAALTVMAMDVRHVLYGPSLRSRIIQRLQKSKTALWAFG--LTDEVFAAATAKLVRN 132

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

## Protein Sequence Searches - February 2005

All of the sequence databases on ABSS have recently been updated.

- Please note that the curators of the UniProt database have purged some temporary accession numbers from the most recent version of UniProt. These sequences have been assigned new permanent accession numbers. The new UniProt record may not contain the previous temporary accession number.
- If you encounter an accession number from an older search run against UniProt (results file extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

When submitting sequence search results for scanning into IFW, please include a copy of this attachment to assist any future Examiners or members of the public who may encounter UniProt temporary accession numbers.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                          US-10-073-293A-4

Sequence 10187, Application US/09489039A

Patent No. 6610836
GENERAL INFORMATION
GENERAL INFORMATION: OF 1 al

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA

TITLE OF INVENTION: NUMBER: US/09/489, 039A

CURRENT APPLICATION NUMBER: US/09/489, 039A

CURRENT APPLICATION NUMBER: US 60/117,747

PRIOR PILING DATE: 1999-01-29

NUMBER OF SEQ ID NOS: 14342

SEQ ID NO 10187
                                                                                                                                                                                                   Sequence 9854, Ap

TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
                                                                                                                                                                                                                                                                                                                                                                            Sequence 27947, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: ACCUENCE ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
